

# Long Live Babiato

You can easily nullify UPOS 6.7 by yourself

Change code in:

`./app/Http/helpers.php`

you can fill in any code activation when you try to install, like:

Code:

0a6b9d2f-52ea-447f-bd61-80cbc8d5a8a9

```
3  /**
4   * boots pos.
5   */
6  function pos_boot($ul, $pt, $lc, $em, $un, $type = 1, $pid = null)
7  {
8      $ch = curl_init();
9      $request_url = ($type == 1) ? base64_decode(config('author.lic1')) : base64_decode(config('author.lic2'));
10
11      $pid = is_null($pid) ? config('author.pid') : $pid;
12
13      $curlConfig = [CURLOPT_URL => $request_url,
14                    CURLOPT_POST => true,
15                    CURLOPT_RETURNTRANSFER => true,
16                    CURLOPT_SSL_VERIFYHOST => false,
17                    CURLOPT_SSL_VERIFYPEER => false,
18                    CURLOPT_POSTFIELDS => [
19                        'url' => $ul,
20                        'path' => $pt,
21                        'license_code' => $lc,
22                        'email' => $em,
23                        'username' => $un,
24                        'product_id' => $pid,
25                    ],
26                ];
27      curl_setopt_array($ch, $curlConfig);
28
29      $result = '{"flag":"valid"}'; ← 1. Add this code
30      $result = curl_exec($ch);
31
32      if (curl_errno($ch)) {
33          $error_msg = 'CURL ' . 'E' . 'rror: ' . 'n';
34          $error_msg .= curl_errno($ch);
35
36          return redirect()->back()
37              ->with('error', $error_msg);
38      }
39      curl_close($ch); ← 2. Comment line 30-38
40
41  }
```

This way supports bypassing the installer activation and updater. Also, this can suppress the activation code when calling the developer API URL.

In this way, we can auto-bypass so many of the official add-ons.

Thanks to @sari25 for the nulled method.
